Please amend the Abstract of Disclosure as follows:

Disclosed is a method for manufacturing multi-level interconnections using a dual damascene process. The method includes: forming a first interconnection line in a second interlayer insulating layer and a first etching stop layer sequentially formed on a first interlayer insulating layer disposed on a semiconductor substrate; forming a first third interlayer insulating layer on the first interconnection line and second interlayer insulating layer; forming a first second etching stop layer on the first third interlayer insulating layer; forming a via hole exposing the first interconnection line by selectively etching the first second etching stop layer and the first third interlayer insulating layer; forming etching stop patterns around an inlet of the via hole by selectively etching the first second etching stop layer; forming a second fourth interlayer insulating layer on the etching stop pattern patterns and the first third interlayer insulating layer; forming a trench by selectively etching the second fourth interlayer insulating layer; and forming a conductive layer in the trench and in the via hole.
